

Theresa Hoke is the Director of Health Services Research at FHI 360, where she manages multi-disciplinary teams in conducting implementation research to improve primary health care services in resource-poor settings. In her 20 years at FHI 360, she has led studies to examine the feasibility, acceptability, scalability, and real-world effectiveness of a range of public health interventions. She is currently co-leading an implementation science portfolio supporting introduction of pre-exposure prophylaxis (PrEP) interventions for HIV prevention in sub-Saharan Africa. Her earlier implementation research in South Africa, Zimbabwe, Uganda, Tanzania, and Kenya provided evidence to program managers about effective linkages between HIV and family planning services. Another investigation in Madagascar supported the design of a nationally implemented intervention for provision of injectable contraceptives by community health workers. Dr. Hoke earned her Master of Public Health in Maternal and Child Health and her doctorate in Health Policy and Administration, both from the University of North Carolina at Chapel Hill. Her commitment to global health traces back to her two years working in a health center in rural Niger as a volunteer nutrition educator for Peace Corps.
